

1 Summary

In this video, José Luis Cava addresses two fundamental questions: what it takes to become a profitable speculator in the stock market, and whether recent insider selling at OpenAI signals a top for artificial intelligence stocks. He begins by analyzing the news that 600 OpenAI employees sold shares worth \$6.6 billion, netting an average of \$11 million each. Despite this massive sell-off, Cava argues it does **not necessarily indicate a market top**. He explains that insiders sold because a buyer appeared offering a significant stake in the company, and in his experience, insiders are often wrong about future price movements. Moreover, with large sums of money involved, the sellers may simply prefer “a bird in hand than two in the bush,” given that no one can predict the future. He also notes strong buying activity in other AI-related placements, such as Anthropic and SpaceX, suggesting the sector still has upside potential.

The core of the video focuses on **what defines a “good speculator”** and how to become one, especially for young people who, according to Cava, are being systematically impoverished by monetary degradation caused by the political class. He distinguishes between two approaches: investing in index funds to defend against currency debasement (yielding 8-10% annually with significant drawdowns) and true speculation, which can generate much larger returns. For Cava, the **winning profile** is not mere passion for the markets, but rather **unshakable self-belief and resilience**—the conviction that no matter what problems arise, one will overcome them. He emphasizes that this mindset can be learned through exposure to successful traders and mentors, even if it is not innate.

Cava then outlines a practical path to becoming profitable. First, acquire **one solid trading “trick” or system** from books, social media, or mentors. He notes that even world champion traders typically only have two or three core setups with variations. The trick is never perfect and works with probabilities, so one must accept a percentage of failures. Second, **execute many trades**—hundreds per year—to internalize the system through repetition and routine. He compares this to learning any profession: mastery comes from constant practice. Third, **control losses rigorously**. Cava advocates starting with very small positions (even just a few shares) to minimize the cost of learning, treating commissions as tuition for a master’s degree. He claims that with a proper system and strict loss control, one can be profitable even with a win rate below 30%. Fourth, find **a balance between small recurring profits and occasional “big hits”** (pelotazos). He suggests using small trades to finance the stops on larger, higher-conviction positions.

Finally, Cava estimates that **it takes approximately two to three years** of consistent, disciplined trading to become consistently profitable—depending on individual aptitude and dedication. He urges viewers to start immediately, as time is their most valuable asset. He concludes by reminding his audience that understanding monetary policy, central bank liquidity, and macroeconomic trends is essential for long-term speculators, directing them to his series “Why I Am Bullish” for further guidance.

2 Schema

- **Two key questions:**

1. What makes a profitable speculator?
2. Does OpenAI insider selling signal an AI top?

- **OpenAI insider selling:**

- \$6.6B sold by 600 employees (~\$11M average)
- **Not necessarily a top** - insiders are often wrong; buyer exists; other AI placements (Anthropic, SpaceX) strong

- **Becoming a profitable speculator:**

1. **Winning profile:**

- **Self-belief and resilience**, not passion
- Conviction to overcome any problem
- Can be learned from mentors

2. **The “trick”:**

- One solid trading system (2-3 setups max)
- **Probabilistic** - accepts losses as normal
- Test and incorporate content regardless of source

3. **Execution:**

- **Many operations** (300-500/year) to internalize system
- Learn through repetition and routine

4. **Loss control:**

- Start small (few shares) to minimize learning cost
- **Profit possible with <30% win rate** if losses are controlled

5. **Balance:**

- Small recurring trades finance stops on “big hits”

- **Timeline to profitability:**

- ~**2-3 years** of consistent, disciplined trading
- Geniuses may do it in 1 year; start now

- **Final advice:**

- Study monetary policy and central bank liquidity
- Long-term speculation leverages liquidity trends
